

Eyelift and Lips Enhancement, Smokers Lines Reduction

Gabriela Mercik

Dr. Gabriela Clinic, London, UK

We will address one of the most common problems of ageing – the appearance of lines and wrinkles on mature skin.

By using the Fotona SP Dynamis system with Er:YAG and Nd:YAG crystals, we can reduce deep lines and wrinkles around the eyes, and we can also enhance the lips with Er:YAG.

Additionally we stimulate collagen production to sustain the results of the treatment and visibly reduce the ageing of the skin.

The methods which we shall present, have brought not only good results after a couple of sessions, but additionally help to rejuvenate of the skin, with sustained effects of the treatments lasting for a longer period of time.

We have produced astounding results after just a couple of sessions and we will be delighted to share our findings of the above-mentioned treatments.

Fractional Ablative Qs Nd:YAG – the Minimally Invasive Laser Therapy for Acne Scars

Edin Suljagić

*Dermatology and Cosmetic Center "Farah", Tuzla, Bosnia and
Herzegovina*

The recent introduction of the fractional ablative Qs Nd:YAG laser modality has opened new possibilities for the treatment of various scars. Ablative fractional scar revision appeared on the aesthetic market some ten years ago, and there are already well established therapies with other fractional ablative laser sources (like are Er:YAG and CO₂). It is known that the results obtained with these lasers are quite good, but the treatments are associated with a

certain downtime and sometimes also with complications. Now that the newer modality – ablative fractional Qs Nd:YAG – was introduced to the market by Fotona a few years ago, and with the launch of the StarWalker laser system, this modality has become easily available to practitioners.

In our clinic we started to use ablative fractional Qs Nd:YAG with the StarWalker laser system using the FS20A handpiece and MaQX (1-10) modalities for the treatment of acne scars. Having a long experiences with fractional ablative Er:YAG and CO₂, we were able to quickly recognize the advantages of the new ablative fractional QS Nd:YAG modality, finding it less invasive and producing good results, with less downtime and a lower level of complications. In this presentation we shall show our first results from using this new modality for acne scars.

Neodymium Multi-pulse Skin Conditioning

Julio Cesar Velez, Sebastian Velez

Melasma is a complex condition that has been difficult to treat, with improvements only sustainable for short periods of time. We have implemented a multifactorial approach that not only treats the symptoms but mainly addresses the underlying cause of melasma.

Our proposed protocol is composed of 3 steps that are always used and a fourth step according to the progression; each step is made with specific objectives, 4-8 sessions every 15 days.

It is a promising treatment that to date is showing high effectiveness with results maintained over time, which makes it different from what exists to date. It is necessary to expand the sample and the use of objective measurement instruments.
